ABSTRACT

Objective: Characterizing in the literature the importance of the care of obstetric nurses in humanized practices during labor. Method: An integrative review with period from January 2003 to January 2021. The search occurred through the Virtual Health Library, in the databases Latin American and Caribbean Literature in Health Sciences, Medical Literature Analysis and Retrieval System Online and Base of Nursing Data. The articles were selected in March 2021. Results: The role of obstetric nurses is characterized by the relevance of childbirth care, through humanized practices such as the application of non-pharmacological measures for pain relief, promotion of care and comfort, besides encouraging women's autonomy, avoiding unnecessary behavior. Conclusion: Obstetric nurses are responsible and encouraging humanized practices during labor, as they recognize the benefits and have the necessary knowledge to perform quality care.

INTRODUCTION

It is known that the discussion about humanized care within the health sector generated a great repercussion, mainly in relation to births. The humanization of childbirth is made up of behaviors and procedures that favor the healthy and physiological event of labor and birth, as it respects the natural process and avoids the use of interventionist and unnecessary behaviors, which put the mother and baby at risk.¹

In Brazil, around three million births take place annually, 98% of which occur in a hospital environment (public or private). In recent years, technology and obstetric procedures have made significant advances, which has resulted in a decrease in maternal and perinatal morbidity and mortality rates.²

However, there are numerous cases of unnecessary interventions, offensive speech and patient exposure, which can occur from prenatal care, during childbirth and even postpartum, which are considered obstetric violence. Such situations have become common within the obstetric field, which has led to a debate on issues and humanized practices related to childbirth.³
According to the National Guidelines for Assistance to Normal Birth, in recent decades, obstetric practice has undergone major changes, mainly in the promotion and recovery of the natural and physiological characteristics surrounding labor and birth, due to the influences of public opinion and service clients' health, in addition to the emergence of new technologies and scientific evidence in developed countries.²

Childbirth is a natural and special process for women and must be respected, and it is nursing's duty to provide support, both physical and emotional, for the woman in labor and her family. It must be taken into account that when we think about natural birth, the idea of a painful and difficult moment comes to mind. However, obstetric nurses as educators contribute to changing this culture through humanized assistance, explaining the advantages and safety of a normal birth for the woman and the baby.⁴

Therefore, the present study is relevant to highlight labor care practices carried out by obstetric nurses within hospital services. Therefore, the study aims to characterize in the literature the importance of assistance from obstetric nurses in humanized practices during labor.

METHOD

This is an integrative literature review composed of six stages.⁵ In stage 1, the theme and research question were elaborated, where the PICo strategy was adopted, where“P” (population) obstetric nurses; “I” (Interest) Humanized practices during labor and “Co” (context) hospital environment. Therefore, the guiding question was: How important is the assistance of obstetric nurses in humanized practices during labour in the hospital environment?

In stage 2, the inclusion criteria were adopted: articles in English, Portuguese and Spanish available in full in the databases selected for the present study; that address the role of obstetric nurses in humanized practices during humanized labor in the hospital environment; published from January 2003 to January 2021. Exclusion criteria: review articles; editorials, case reports and opinion reports.

The time frame was chosen because the investigations were considered worthy and timely, after the publication, in 2003, of the National Humanization Policy (PNH), which seeks to put into practice the principles of the Unified Health System (SUS) in the daily lives of health services, producing changes in the ways of managing and caring.⁶

The survey of studies was carried out by the Virtual Health Library (VHL), in March 2021, in the databases Latin American and Caribbean Literature in Health Sciences (LILACS), Medical Literature Analysis and Retrieval System Online (MedLine) and Nursing Database (BDENf). The Health
Sciences Descriptors (DeCS) were used, with the following Boolean operators: “Obstetric Nursing AND Humanized Delivery AND Labor AND Hospital Care” and “Obstetric Nursing AND Humanizing Delivery AND Labor, Obstetric AND Hospital Care”.

To extract the data (Stage 3), they were initially analyzed by reading the titles and abstracts in order to identify whether they had the potential to answer the question established in the previous stage. After this refinement, the articles were read in full and for those that met the inclusion criteria, information was extracted for the context of this research, namely: authors, year of publication, country, method, humanized practices, objective(s) and main results.

The search, selection and analysis of articles were carried out by two independent examiners and in cases of disagreement, a third examiner was invited to participate in the consensus meeting regarding the selection of studies. After repeated readings, the articles that made up the final sample were organized in a Microsoft Office Excel spreadsheet, version 2016, and the variables were presented descriptively in a table, making interpretations and comparisons between the similar and conflicting results of the selected studies (Steps 4 and 5).

Step 6 consisted of presenting the review/synthesis of the evidence found, enabling the reader to understand the importance of obstetric nursing and its positive contributions to the humanized care of women during labor.

**RESULTS**

82 studies were identified in the databases. Of these, 19 were excluded due to duplication and 35 after reading the titles and abstracts. After reading in full, 28 were excluded for not meeting the eligibility criteria – five articles were eligible to compose this integrative review. The steps taken to search and select articles are shown in Figure 1.

Among the selected studies, the year of publication ranged from 2013 to 2020 and all studies were carried out in Brazil (100%). Of these, three (60%) presented a qualitative approach and two (40%) a quantitative approach. The humanized practices used during labor are presented in table 1.

The role of the obstetric nurse is to offer and explain to women about humanized practices, pain relief methods and encourage their autonomy. This professional is a great supporter of the use of non-pharmacological methods, such as spray
baths, walking and changing positions during labor and therapeutic massage for pain relief.

And more than that, your role is to put your knowledge into practice with the aim of providing a safe and humanized birth.

**DISCUSSION**

After reading all the articles, there were common points that characterized the role of obstetric nursing and its positive contributions to humanized childbirth care, enabling a pleasant experience for women, respecting the physiology of childbirth and women's protagonism.

Humanized practices during labour, especially in relation to non-pharmacological pain relief methods, are used by obstetric nurses, as pointed out in a study carried out in a public maternity hospital in the state of Piauí, and are accepted by parturients, enabling feelings of trust and well-being.⁷ ⁸

These professionals are responsible for the growth in the use of good practices during labor, respecting individuality and increasing women's autonomy at this time. They encourage women's protagonism and empowerment, as well as welcoming women, carrying out techniques, procedures and guidance, and providing safety and support throughout the process, characterizing their important role in assisting this population.⁹ ¹⁰

Thus, obstetric nursing is also a great promoter of the use of non-pharmacological methods for pain relief, such as sprinkling, therapeutic massage, walking and changing positions during labor, which are recommended by the World Health Organization (WHO), since these practices have been shown to significantly reduce the use of pain-relieving drugs and epidural analgesia.¹¹

A study carried out in a hospital in the state of Goiás showed that the inclusion of obstetric nurses in the humanized practice of childbirth care had benefits in terms of reduced interventions and greater satisfaction among the women attended. This reinforces the importance of these professionals during labor.¹²

It is also noteworthy that although the importance of obstetric nurses is evident, there is still a lack of recognition by patients, institutions and other health professionals who accompany parturients.⁹ Obstetric care is centered on medical professionals and interventionist measures, and a large part of the population is unaware that obstetric nurses have the skills to provide normal childbirth care based on the best scientific evidence. The recognition of this professional area of nursing is very recent, but bodies such as the WHO and the Ministry of Health have begun to invest in and qualify these professionals because they understand their value and significance.⁹ ¹⁰
The study's limitations include the number of studies identified on the subject and the fact that other international databases were not selected, limiting the inclusion of other studies.

CONCLUSION

It can be concluded that obstetric nursing care is extremely important for the humanization of childbirth, given that these professionals are responsible for and encourage humanized practices during labour, as they recognize its benefits and have the necessary knowledge and skills to provide quality care.

It is clear that the work of obstetric nurses transforms the experience of childbirth into a more pleasant and positive moment for the woman and her family. Through non-pharmacological pain relief methods, the promotion of maternal autonomy and self-esteem, as well as respect for the privacy and individuality of each patient, this unique moment in women's lives is humanized.

Unfortunately, the recognition of these professionals by society is lacking, and it is essential that health bodies and institutions promote the appreciation and dissemination of the importance of these professionals.
